FEBRUARY 2018

Picture of The Month

Aashob Qazi Ashraf, MD; MS; DNB (MCh); MNAMS; MESSO; FSSO(USA)

This is the dissected neck in a 50 years old female. It is a case of submandibular gland tumor. Note and mark the various structures. What anatomical variant can you identify?

Send your answer to us on Rapid Response.

Author Information: Dr. Aashob Qazi Ashraf, MD; MS; DNB (MCh); MNAMS; MESSO; FSSO(USA) is Senior Consultant, Surgical Oncology in Noora Hospital, Srinagar, Kashmir, India. Email: aashob@gmail.com

Answer to last month's POTM January 2018

A 25 years old male presented with complaints of pain and eroded skin of the fingers of his right hand. He gives history of similar problem during winters in the last two years only. He is a computer technician working in a Cyber Café. What is your diagnosis?

**The Correct Answer**

The young man has **frostbite** of the skin around his metacarpo-phalangeal and proximal inter-phalangeal joints (IPJs). He wears partial mittens while working with his mouse on the computer at his Cyber Café. Therefore the distal IPJs remain flexed and are not exposed to cold. He had history of cold intolerance and turned out to have **hypothyroidism** too.
